http://127.0.0.1:3764 | Open in Browser

Publish

Continuous-time meta-analysis on standardized lagged effects (Φ):CTmetaBy using this app you agree with the [Terms of Usage](#)Contact

Input

Fill in the **number of studies** included in your meta-analysis, that is, the integer S (≥ 2).

2

Meta-analysis settings

Select your **type of meta-analysis model**, that is, fixed- or random-effects.
Note: The fixed-effects model (default) assumes that variance in parameter estimates comes from sampling variance alone.

Fixed-effects (FE) model

Do you want to **add moderators** to your meta-analysis model?
Note: These will be predictors in the meta-analysis model, which models the lagged effects between two variables. Therefore, these predictors are called moderators.

no

Input from the S studies

Fill in the **number of outcome variables**, that is, the integer q (≥ 1); which then implies a q times q (standardized) lagged effects matrix Φ .

1

Select the tab delimited .txt file that contains the (q times q) **lagged effects matrix Φ for each study**; for each study below each other. If you want to separate the matrices, use headers starting with a '#'.
In case you have (lagged) correlations, you can transform those to Φ using the Shiny app 'Standardizing and/or transforming lagged regression estimates'.

Browse...No file selected

Select your **type of covariance matrix input**:

Residual covariance matrix (Sigma)

Select the tab delimited .txt file that contains the (q times q) **covariance matrix for each study**; for each study below each other. If you want to separate the matrices, use headers starting with a '#'.
Browse...No file selected

Output

Meta-analysis results using the transformed standardized $\Phi(\Delta_T^*)$'s and their (co)variances

NULL

Note: In case of the ERROR 'Number of parameters to be estimated is larger than the number of observations.', a model without moderators (or with less) and/or a FE model instead of a RE model can help.

Plot of $\Phi(\Delta_T)$

Open app: Bottom

D:/Shiny Apps and R packages/AF_5_CT meta-analysis on lagged effects - Shiny

http://127.0.0.1:3764 | Open in Browser | Publish

Select your type of covariance matrix input:

Residual covariance matrix (Sigma)

Select the tab delimited .txt file that contains the (q times q) covariance matrix for each study; for each study below each other. If you want to separate the matrices, use headers starting with a '#'.
Browse... No file selected

Select the tab delimited .txt file that contains the number of observations for each study; for each study below each other.
This refers to either N persons or, in case of T measurement occasions, to T-1 lagged observations.
Browse... No file selected

Select the tab delimited .txt file that contains the value for the used time-interval (Δ_T) for each study; for each study below each other. If needed, use a dot (.) as decimal mark.
Browse... No file selected

Fill in the value for the time-interval of interest (Δ_T^*). If needed, use a dot (.) as decimal mark.
1

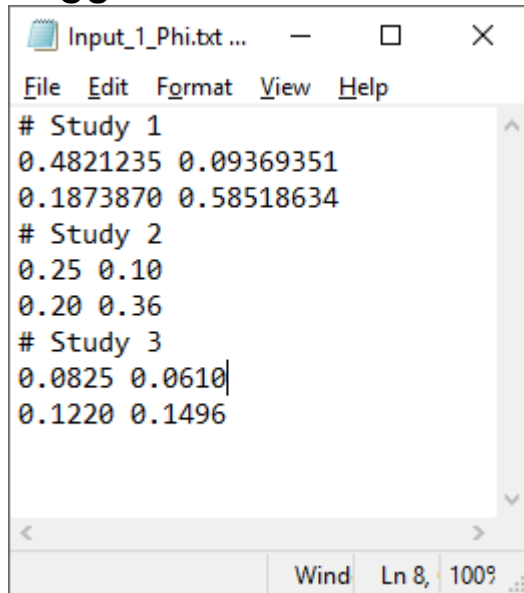

Plot adjustment settings (for output)
Fill in the lower bound (Min) and upper bound (Max) of Δ_T for the respective plots, with $\text{Max} > \text{Min} \geq 0$; The step size (Step) is used to calculate the plots, with $\text{Step} < \text{Max} - \text{Min}$. If needed, use a dot (.) as decimal mark.

Input: Simple example

Combine $S=3$ studies

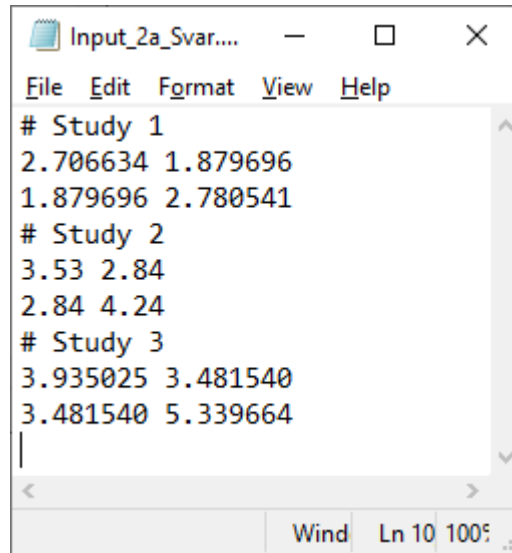

In each, we have $q=2$ outcome variables; and thus the following 2×2 matrices:

Lagged effects matrix:

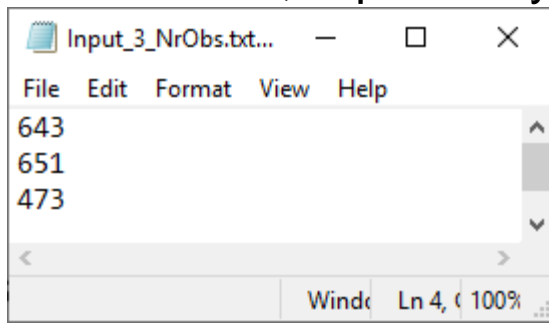

```
File Edit Format View Help
# Study 1
0.4821235 0.09369351
0.1873870 0.58518634
# Study 2
0.25 0.10
0.20 0.36
# Study 3
0.0825 0.0610
0.1220 0.1496
```

Residual covariance matrix:

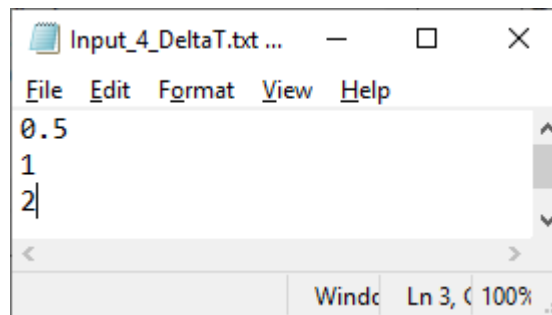

```
File Edit Format View Help
# Study 1
2.706634 1.879696
1.879696 2.780541
# Study 2
3.53 2.84
2.84 4.24
# Study 3
3.935025 3.481540
3.481540 5.339664
```

Furthermore, N per study:

Publish

Continuous-time meta-analysis on standardized lagged effects (Φ):

C Tmeta

By using this app you agree with the [Terms of Usage](#)

Contact

Input

Fill in the **number of studies** included in your meta-analysis, that is, the integer S (≥ 2).

3

Meta-analysis settings

Select your **type of meta-analysis model**, that is, fixed- or random-effects.

Note: The fixed-effects model (default) assumes that variance in parameter estimates comes from sampling variance alone.

Random-effects (RE) model

Do you want to **add moderators** to your meta-analysis model?

Note: These will be predictors in the meta-analysis model, which models the lagged effects between two variables. Therefore, these predictors are called moderators.

yes; you can add the variable(s) next

Select the tab delimited .txt file that contains the **moderator(s) / variable(s)**, each of length S (i.e., S rows) and each with a variable name header (i.e., column name).

In case of **group** variable(s) / factor(s), you should add **dummy** variables; otherwise, a linear relationship will be estimated.

In case of **continuous** variable(s), you should probably **center** the variables, because the resulting estimates will be those for which the moderators have the value 0.

Upload complete

Input from the S studies

Fill in the **number of outcome variables**, that is, the integer q (≥ 1); which then implies a q times q (standardized) lagged effects matrix Φ .

2

Select the tab delimited .txt file that contains the (q times q) **lagged effects matrix Φ for each study**; for each study below each other. If you want to separate the matrices, use headers starting with a '#'.
In case you have (lagged) correlations, you can transform those to Φ using the Shiny app 'Standardizing and/or transforming lagged regression estimates'.

Output

Meta-analysis results using the transformed standardized $\Phi(\Delta_T^*)$'s and their (co)variances

Select the tab delimited .txt file that contains the value for the **used time-interval (Δ_T)** for each study; for each study below each other. If needed, use a dot (.) as decimal mark.

Browse... Input_4_DeltaT.txt

Upload complete

Fill in the value for the **time-interval of interest (Δ_T^*)**. If needed, use a dot (.) as decimal mark.

1

Plot adjustment settings (for output)

Fill in the lower bound (Min) and upper bound (Max) of Δ_T for the respective plots, with $\text{Max} > \text{Min} \geq 0$; The step size (Step) is used to calculate the plots, with $\text{Step} < \text{Max} - \text{Min}$. If needed, use a dot (.) as decimal mark.
